

Quality Requirements

The subsystem shall allow operators to configure tenant-specific branding (e.g. university logos, brand colour schemes, typography, and dedicated subdomains, etc.)

Security and Privacy Protection

Access to the tenant-specific branding should only be accessed by the tenant themselves by using their username and password. Their branding should also only be able to be modified by someone with the username and password.

Performance

When a user requests access to their tenant-specific branding, the system should respond within 10 seconds of the users request.

Reliability

- **Failure rate:** The platform operator subsystem should operate continuously, only failing at most 3 times a year
- **Mean time to recovery:** If a failure happens, the platform operator subsystem should recover to normal within at least 10 hours
- **Availability:** The platform operator subsystem should not be out of service more than 200 hours of the year

Scalability

The subsystem should be able to accommodate the specific branding for all 170 different universities in the United Kingdom. It should be able to process more accesses during the August/September time, when university faculty are preparing for the new academic year.
